

Cross-Platform Control Framework

Seven Platforms, One Missing Layer

SageMaker in one business unit, Copilot in another, Vertex AI, Claude, GPT-4, Hugging Face, Watson. Seven platforms, seven governance surfaces, and in my last three audits, not one consolidated view across any of them.

Build a single inventory across every platform, replacing the seven separate lists seven teams currently maintain without talking to each other.

Assign one risk owner accountable for the aggregate picture, even if individual platform decisions stay decentralized.

Standardize reporting across platforms, so "what's our AI risk exposure" has a single answer instead of seven incompatible ones.

THE BOTTOM LINE

A single inventory across every AI platform, with one accountable owner, is the control gap that surfaces first in an audit — and the first deliverable I build in every AI Risk Audit I run.

Seven platforms. One missing layer — solutionsbyjewel.com
